

1. QA department receives the video calling and instant messaging mobile app to execute the verification of one of the app module. The task is to test the Private chat in the app. QA department also gets the SRS that describes how this module should work. According to the SRS, the Private chat module has the following features:

Private chat page is a chat room for 1x1 chat;

When user types his message and sends it to the chatroom, it appears at the right side of the screen;

Opponent's messages are shown at the left side of the screen;

The last sent message is displayed at the bottom of the chat list.

Buttons set:

- Send – sends whatever is entered in the Message text field. Message text field can contain text/numeric/symbolic characters (512 chars max);
- Emojis – opens Emoticons tab;
- Attachment – allows user to send an attachment in private chat. User can take a picture or choose any from the Gallery. An attachment is sent automatically after choosing. An attachment is sent as a separate message (there is no possibility to send a message with attachment file). User can't attach more than one file at once. Spinner shows a downloading process. User can upload images only.

Messages have following statuses;

- Delivered – message is sent to the server;
- Read – message is read by the opponent.

What kind of verification should be executed? Please, write the checklist to cover all requirements.

2. Your checklist (Task #1) is the test coverage of the Private chat module that equals 100%. Your time is limited and you can execute only 30% of your checklist before release. Please compose new checklist including verifications that will be executed. Rank them by priority and explain your choice.
